1.1. Structure of the guide

This guide is arranged so that one chapter builds upon the other.
Chapter 2: Basic safety instructions
Chapter 3: Main steps for installing the device
.....

1.2. Typographical Conventions

The following typographical conventions are used in this manual.

Enumerations

Enumeration is shown in the form of bulleted lists.

- Entry 1,
- Entry 2

Actions

Action instructions are indicated by a preceding triangle. The result of an action is indicated by an arrow.

- Action instruction 1.
- Result of action.
- Action instruction 2.

Actions can also be indicated as numbers in parentheses.

- (1) Step 1
- (2) Step 2

Syntax

Numbers:

Decimal numbers are shown without additional information (e.g. 123),

Hexadecimal numbers are shown with the additional indicator hex (e.g., 00_{hex}) or the prefix "0x" (e.g., 0x00).

Cross-references

Cross-references indicate where additional information on the topic is located.

1.3. Symbols

Note

This symbol indicates general notes.

Attention!

This symbol indicates a security notice which must be observed.

1.4. Abbreviations

| | |
|-----|-------------------------------|
| BNI | Balluff Network Interface |
| I | Standard input port |
| EIP | EtherNet/IP™ |
| EMC | Electromagnetic compatibility |
| FE | Function earth |
| O | Standard output port |

1.5. Deviating views

Product views and illustrations in this manual may differ from the actual product. They are intended only as illustrative material.

2 Safety

2.1. Intended Use

The BNI EIP-... is a decentralized IO-Link, input and output module for connecting to the EtherNet/IP™ network.

2.2. Installation and Startup

Attention!

Installation and startup are to be performed by trained technical personnel only. Skilled specialists are people who are familiar with the work such as installation and the operation of the product and have the necessary qualifications for these tasks. Any damage resulting from unauthorized tampering or improper use shall void warranty and liability claims against the manufacturer. The operator is responsible for ensuring that the valid safety and accident prevention regulations are observed in specific individual cases.

2.3. General Safety Notes

Commissioning and inspection

Before commissioning, carefully read the User's Guide.

The system must not be used in applications in which the safety of persons depends on the function of the device.

Intended use

Warranty and liability claims against the manufacturer shall be rendered void by damage from:

- Unauthorized tampering
- Improper use
- Use, installation or handling contrary to the instructions provided in this User's Guide.

Obligations of the owner/operator

The device is a piece of equipment in accordance with EMC Class A. This device can produce RF noise. The owner/operator must take appropriate precautionary measures against this for its use. The device may be used only with a power supply approved for this. Only approved cables may be connected.

Malfunctions

In the event of defects and device malfunctions that cannot be rectified, the device must be taken out of operation and protected against unauthorized use.

Intended use is ensured only when the housing is fully installed.

2.4. Resistance to Aggressive Substances

Attention!

The BNI modules always have good chemical and oil resistance. When used in aggressive media (such as chemicals, oils, lubricants and coolants, each in a high concentration (i.e. too little water content)), the material must first be checked for resistance in the particular application. No defect claims may be asserted in the event of a failure or damage to the BNI modules caused by such aggressive media.

Dangerous Voltage

Attention!

Before working on the device, switch off its power supply.

Note

In the interest of continuous improvement of the product, Balluff GmbH reserves the right to change the technical data of the product and the content of these instructions at any time without notice.

3.1. Module Overview

Figure – Overview: BNI EIP-508-105-Z015

- | | | | |
|---|--------------------------------------|----|--------------------------------------|
| 1 | Mounting hole | 10 | Port 14 / 15 (IO-Link, standard I/O) |
| 2 | EtherNet/IP™ port 2 | 11 | Port 06 / 07 (IO-Link, standard I/O) |
| 3 | Display | 12 | Port 04 / 05 (IO-Link, standard I/O) |
| 4 | Power supply, input | 13 | Port 02 / 03 (IO-Link, standard I/O) |
| 5 | Status LED: communication / module | 14 | Port 00 / 01 (IO-Link, standard I/O) |
| 6 | Port 08 / 09 (IO-Link, standard I/O) | 15 | Power supply, output |
| 7 | Pin/port LED: signal status | 16 | EtherNet/IP™ port 1 |
| 8 | Port 10 / 11 (IO-Link, standard I/O) | 17 | Ground connection |
| 9 | Port 12 / 13 (IO-Link, standard I/O) | | |

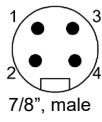

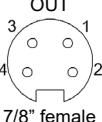

3First Steps

3.2. Mechanical Connection

The module is secured by means of two M6 screws and two washers. Insulation support is available separately.

3.3. Electrical Connection

Power Supply

| <div> <div>IN</div>  <div>7/8", male</div> </div> | Pin | Function | Description |
|--|-----|----------|---|
| | 1 | +24 V | Actuator supply |
| | 2 | +24 V | Module / sensor supply |
| | 3 | 0 V | GND module / sensor and actuator supply |
| <div> <div>OUT</div>  <div>7/8" female</div> </div> | 4 | | |

Note

Where possible, use a separate power source to supply the sensor/bus and actuator with power.
Total current < 9 A The total current of all modules must not exceed 9 A even in the case of series connection of the actuator supply.

Grounding

Note

The functional ground connection between housing and machine must have a low impedance and be as short as possible.

Ethernet IP Interface

M12, D-coded, female

| Pin | Function | |
|-----|----------|-----------------|
| 1 | Tx+ | Transmit Data + |
| 2 | Rx+ | Receive Data + |
| 3 | Tx- | Transmit Data - |
| 4 | Rx- | Receive Data - |

3 First Steps

I/O Port

M12, A-coded, female

| Pin | Function |
|-----|-----------------|
| 1 | +24 V, 200 mA |
| 2 | Input/output 2A |
| 3 | GND |
| 4 | Input/output 2A |
| 5 | FE |

Note

For the digital sensor inputs, refer to guideline on inputs EN 61131-2, Type 2.

Note

The total current of the module must not exceed 9 A.

Note

Unused I/O ports must be provided with cover caps to comply with degree of protection IP67.

IO-Link Port

M12, A-coded, female

| Pin | Function |
|-----|-------------------------|
| 1 | +24 V, 1.6 A |
| 2 | Input/output 2A |
| 3 | GND |
| 4 | IO-Link/input/output 2A |
| 5 | n.a. |

Port

| | Port | |
|----------------------|----------------------------|----------------------------|
| | 00/01, 02/03, 08/09, 10/11 | 04/05, 06/07, 12/13, 14/15 |
| BNI EIP-502-105-Z015 | IN / OUT | IN / OUT / IO-Link |
| BNI EIP-508-105-Z015 | IN / OUT / IO-Link | |

4 Technical Data

4.1. Dimensions

4.2. Mechanical Data

| | |
|--------------------------------|--|
| Housing material | Die case zinc, matt nickel plated |
| Enclosure rating per IEC 60529 | IP 67 (only when plugged-in and threaded-in) |
| Supply voltage | 7/8" 4-pin, connector / female |
| Input ports / output ports | M12, A-coded (8x female) |
| Dimensions (W x H x D in mm) | 68 x 224 x 37.9 |
| Type of mounting | Screw mounting with 2 mounting holes |
| Ground strap installation | M4 |
| Weight | Approx. 670 g |

4.3. Operating Conditions

| | |
|---------------------|------------------|
| Ambient temperature | -5 °C ... 70 °C |
| Storage temperature | -25 °C ... 70 °C |

4.4. Electrical Data

| | |
|-----------------------|---|
| Supply voltage | 18...30.2 V DC, in accordance with EN 61131-2 |
| Ripple | < 1% |
| Input current at 24 V | 130 mA |

4 Technical Data

4.5. Ethernet

| | |
|---|---|
| Ethernet IP port | 2 x 10Base/100Base Tx |
| Connection for Ethernet IP port | M12, D-coded, female |
| Cable types in accordance with IEEE 802.3 | Shielded, twisted pair min. STP CAT 5/ STP CAT 5e |
| Data transmission rate | 10/100 Mbps |
| Max. cable length | 100 m |
| Flow control | Half-duplex/full-duplex (IEEE 802.3x pause) |

4.6. Function Indicators

Module Status

| LED | Display | Description |
|-------------|---------------------|--|
| UA | Green | Output power OK |
| | Red, flashing | Low output power (< 18V) |
| | Red | No output power (< 11V) |
| US | Green | Input power OK |
| | Red, flashing | Low input power (< 18V) |
| Mod | Green, flashing | Incorrect or no configuration of the module |
| | Green | Module is working |
| | Red, flashing | Fixed bus clock is not possible |
| | Red-green, flashing | Initial sequence |
| Netw ork | Off | Module has no IP address |
| | Green, flashing | Module has IP, but no connection established |
| | Green | Connection established |
| | Red, flashing | Connection timeout |
| | Red-green, flashing | Initial sequence |
| 100 | Off | Bus clock: 10 Mbps |
| | Yellow | Bus clock: 100 Mbps |
| LNK | Green | Data transfer |

4 Technical Data

Port

Each port has two bicolored LEDs for displaying the I/O statuses.

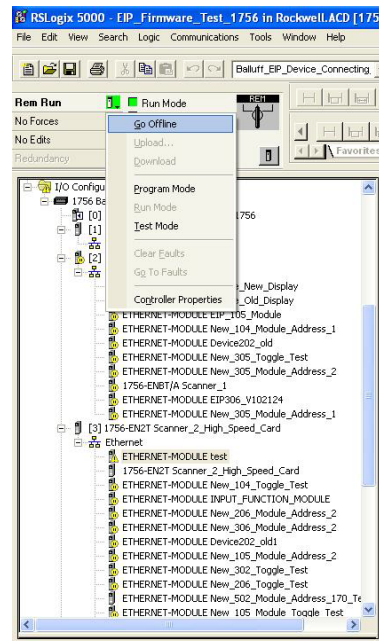

| | Display | Status | Description |
|--------------|-------------------------|---------------|---|
| I/O port | Off | I/O status | The status of the input or output pins is 0 |
| | Yellow | I/O status | The status of the input or output pins is 1 |
| | Red, flashing | Short-circuit | Short-circuit between pin 1 and 3 |
| | Red | Short-circuit | Short-circuit at dedicated pin |
| IO-Link port | Green | IO-Link | IO-Link communication active |
| | Green, flashing | IO-Link | No IO-Link communication |
| | Green, rapidly flashing | IO-Link | IO-Link pre-operate during data storage |
| | Red | Short-circuit | Short-circuit at pin 4 |
| | Red, flashing quickly | IO-Link | Validation failed / Data storage failed / Wrong device for data storage |

5 Integration

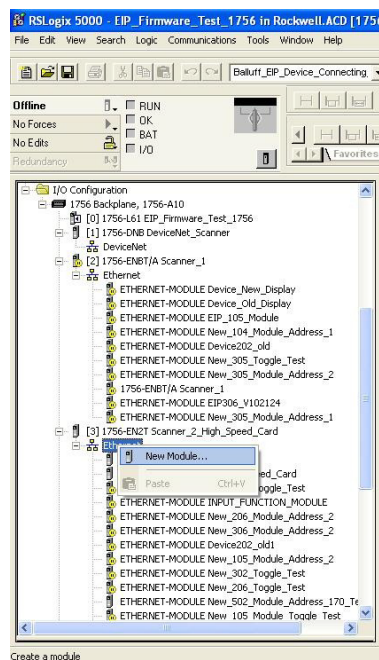

5.1. Integration in Rockwell RS Logix 5000

Here you see an example of how the module can be integrated into a Rockwell RS Logix 5000:

First go offline

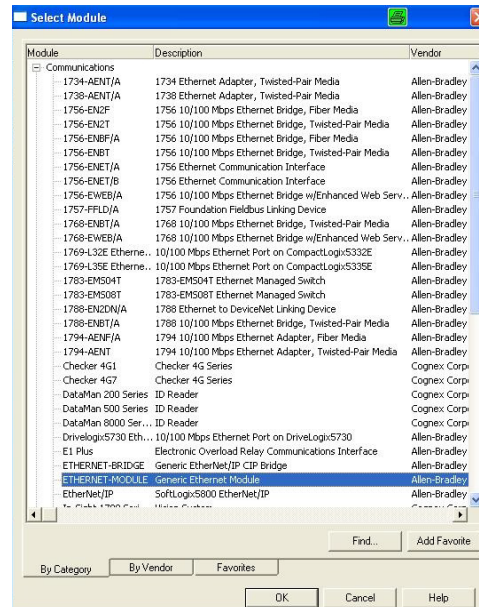

Right-click Ethernet (on the correct scanner card)
Select a new module

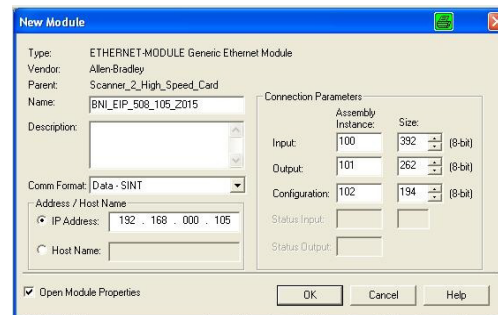

5 Integration

Then select the general Ethernet module as the ETHERNET module in the communication path

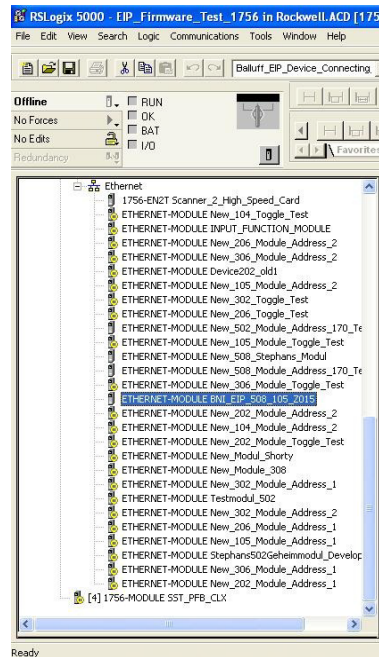

Now enter a user-defined tag name to select the general format Data-SINT, to enter the IP address of the module and to enter the correct connection parameters.

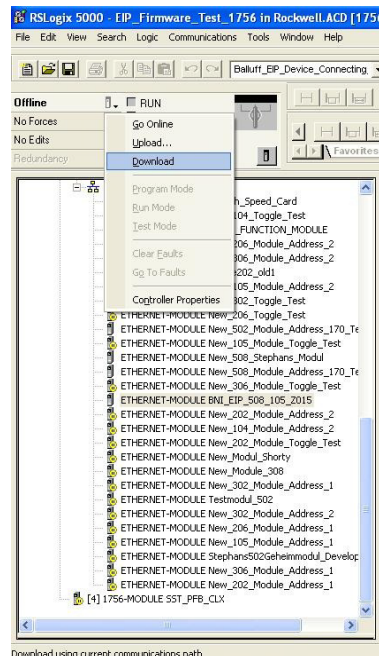

5 Integration

The new module and corresponding controller tags are generated automatically.

Then download the configuration

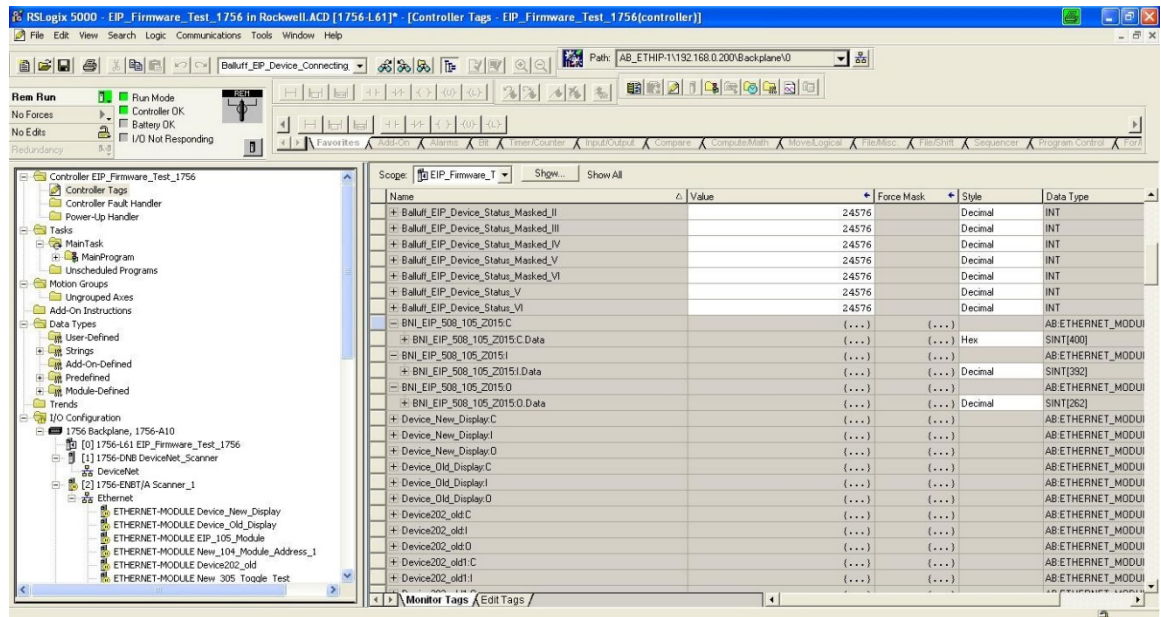

5 Integration

When the download is done, you can observe and control the tags using the Controller Tags option. Make sure you select the correct tag name, which you configured beforehand.

The input, output and configuration data for this is described on the following pages.

You can use these tags for the programming, too.

5 Integration

5.2. Address Specifications

These settings are factory-set.

IP-Adresse: 192.168.1.1
Subnetmaske: 255.255.255.0
Gatewayadresse: 192.168.1.1

5.3. Data Configuration

Please enter the following values in the control system. They describe the data sizes of the input, output and configuration data.

| | Instanc ID | Data length | | | | |
|--------|------------|-------------|-----|-----|-----|---------|
| | | 502 | 508 | 507 | 527 | 508-C06 |
| Input | 100 | 200 | 392 | 196 | 196 | 128 |
| Output | 101 | 134 | 262 | 130 | 128 | 86 |
| CONFIG | 102 | 98 | 194 | 98 | 98 | 0 |

5.4. Configuration Data

The following tables show an allocation of the configuration data sequence. The standard values specified below describe a configuration with the IO-Link function at Pin 4 and standard I/O functions at Pin 2 and 4 of each port. The input and output functions of the configured standard I/O ports are set via the process data.

BNI EIP-502-105-XXXX, BNI EIP-507-005-Z040, BNI EIP-527-005-Z040

| Byte | Slot | Module part | Description |
|---------|------|----------------|---|
| 0...1 | 1 | Module | General configuration for the entire module |
| 2...25 | 2 | IO-Link port 0 | Configuration of IO-Link port 0 |
| 26...49 | 3 | IO-Link port 1 | Configuration of IO-Link port 1 |
| 50...73 | 4 | IO-Link port 2 | Configuration of IO-Link port 2 |
| 74...97 | 5 | IO-Link port 3 | Configuration of IO-Link port 3 |

BNI EIP-508-105-XXXX

| Byte | Slot | Module part | Description |
|-----------|------|----------------|---|
| 0...1 | 1 | Module | General configuration for the entire module |
| 2...25 | 2 | IO-Link port 0 | Configuration of IO-Link port 0 |
| 26...49 | 3 | IO-Link port 1 | Configuration of IO-Link port 1 |
| 50...73 | 4 | IO-Link port 2 | Configuration of IO-Link port 2 |
| 74...97 | 5 | IO-Link port 3 | Configuration of IO-Link port 3 |
| 98...121 | 6 | IO-Link port 4 | Configuration of IO-Link port 4 |
| 122...145 | 7 | IO-Link port 5 | Configuration of IO-Link port 5 |
| 146...169 | 8 | IO-Link port 6 | Configuration of IO-Link port 6 |
| 170...193 | 9 | IO-Link port 7 | Configuration of IO-Link port 7 |

Note

The BNI EIP-508-XXX-XXXX-C06 has no configuration data. These are fixed and can not be changed.

5 Integration

Module Configuration BNI EIP-502-105-XXX

| Byte | Bit | | | | | | | | Description |
|------|-----|---|----|---|---|---|---|---|--|
| | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

| 25 | Parameter server | | | | | | Parameter server 0x8X Enable 0x0X Disable 0x40 Delete 0xX1 Enable upload 0xX2 Disable download | | |
| ... | The data of the other IO-Link ports is structured identically and described in the following. | | | | | | | | |

5 Integration

Cycle Settings

This parameter can be used to influence the IO-Link communication speed. Calculated using the multiplier and the time base, the IO-Link cycle time can be increased. The time base is described in Table B3. The multiplier is entered in decimal form from 0...63.

| Bit | | | | | | | | Description |
|-----------|---|------------|---|---|---|---|---|---|
| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| Time base | | Multiplier | | | | | | Bit 0 to 5: Multiplier These bits contain a 6-bit multiplier for the calculation of MasterCycleTime or MinCycleTime. Permissible values for the multiplier are 0 to 63. |
| | | | | | | | | Bit 6 to 7: Time Base These bits specify the time base for the calculation of MasterCycleTime or MinCycleTime. |

Possible values of MasterCycleTime and MiniCycleTime

| Time base encoding | Time base value | Calculation | Cycle time |
|---|-----------------|----------------------------------|---------------------|
| 00 | 0.1 ms | Multiplier x time base | 0.4 ms to 6.3 ms |
| 01 | 0.4 ms | 6.4 ms + multiplier x time base | 6.4 ms to 31.6 ms |
| 10 | 1.6 ms | 32.0 ms + multiplier x time base | 32.0 ms to 132.8 ms |
| 11 | Reserved | Reserved | Reserved |
| NOTE: The value 0.4 results from the minimum possible transmission time according to A.3.7. | | | |

Validation Settings

No validation: validation deactivated, every device will be accepted.

Compatibility: manufacturer ID and device ID are compared to the IO-Link device data.

Identity: manufacturer ID and device ID and serial number are compared to the IO-Link device data. The IO-Link communication is only started if there is a match.

Parameter Server

Enable: data management functions enabled, parameter data and identification data of the IO-Link device are stored permanently.

Disable: data management functions disabled, stored parameter data and identification data of the IO-Link device remain stored.

Deleted: data management functions disabled, stored parameter data and identification data of the IO-Link device are deleted.

Enable upload:

If only the upload is enabled, the master always starts an upload of the parameter data. In this case, the upload is independent of the upload flag of the IO-Link device. If no data is stored in the Master Port, an upload likewise takes place. (e.g. after deleting the data or before the first data upload)

Enable download:

If only the download is enabled, the master always starts a download of the parameter data. In this case, the download is likewise independent of the upload flag of the IO-Link device. If no data is stored in the Master Port, however, an upload takes place first. (e.g. after deleting the data or before the first data upload)

Enable upload and download:

If the upload and download are enabled, different parameter sets are distinguished depending on the upload flag of the IO-Link device.

If no parameter data is stored in the IO-Link master port, an initial upload takes place. (e.g. after deleting the data or before the first data upload)

If the upload flag is set on the IO-Link device, an upload of the parameter data always takes place.

If no upload flag is set and parameter data has already been stored, a download of the parameter data always takes place.

Note

After the upload of the parameter data, the vendor ID and device ID of the connected IO-Link device are also still saved until the data records are deleted.

When the connected IO-Link device is started, a validation takes place. Thus, only an IO-Link device of the same type can be used for the data management.

If an IO-Link device of a different type is to be used, the contents of the parameter server must be deleted.

The data storage is supported only by IO-Link devices with IO-Link Revision 1.1.

Upload Flag on the IO-Link Device

The upload flag is needed to overwrite already saved data in the parameter server with new parameter data of the same IO-Link device.

To enable the upload flag of an IO-Link device,

the data value 0x05 must be entered in the index 0x02, subindex 0.

(For information about configuration via IO-Link, refer to the "Web Server" chapter under "Device Properties" or the "Configuration via Explicit Messages" chapter under "IO-Link Device Parameterization")

6 Configuration via Explicit Messages

QuickConnect The QuickConnect function makes it faster to boot up and integrate the BNI EIP-50x-105-X015 modules.

Enabling QuickConnect automatically takes over all necessary port properties on the module:

- Static IP address
- Ports at 100 Mbps full-duplex
- Auto-negotiation disabled
- Auto MDI-X disabled
- Prepared for linear topology

You can configure **QuickConnect** via the following class instance attribute of the explicit messages:

| Class | Instance | Attribute | Value |
|------------|----------|-----------|--|
| 245 (0xF5) | 1 (0x01) | 12 (0x0C) | 0: disabled (default) 1: enabled |

Note

For QuickConnect to be enabled, ACD (Address Conflict Detection) must also be enabled. This is switched on by default.

The **ACD** can be reviewed and changed using the following class instance attributes of the explicit messages:

| Class | Instance | Attribute | Value |
|------------|----------|-----------|---|
| 245 (0xF5) | 1 (0x01) | 10 (0x0A) | 0: disabled 1: enabled(default) |

6 Configuration via Explicit Messages

6 Configuration via Explicit Messages

Example with Rockwell Components

Figure 3 - Example System Components

Source:

Allen-Bradley EtherNet/IP QuickConnect Application Technique, Page 12

Please also note the following:

- Direct connection between PLC and QuickConnect slave with crossover cable
- Slave-to-slave connection using patch cable
- For setting up the topology, only the linear topology with a maximum of 20 modules on the tool side is permitted.
- If needed, only one managed switch may be used between the PLC and EtherNet/IP slave.
- To trigger the QuickConnect sequence, an electrical lock signal is required that reads in the supply voltage of the QuickConnect slaves via the controller.

PLC Program

Add Application Logic

Add ladder logic to inhibit and uninhibit QuickConnect I/O modules:

- Run this logic in a periodic task with a recommended 10 ms update rate.
- The logic examples shown configure two ArmorBlock I/O modules. Modify the code as needed to configure as many as 20 ArmorBlock I/O modules.

IMPORTANT A connection time of 500 ms with 20 QuickConnect modules is supported with only a ControlLogix 1756-L7x controller and 1756-EN2T communication module. For average connection times per number of modules, see [Average Timing with Rockwell Automation Products on page 50](#).

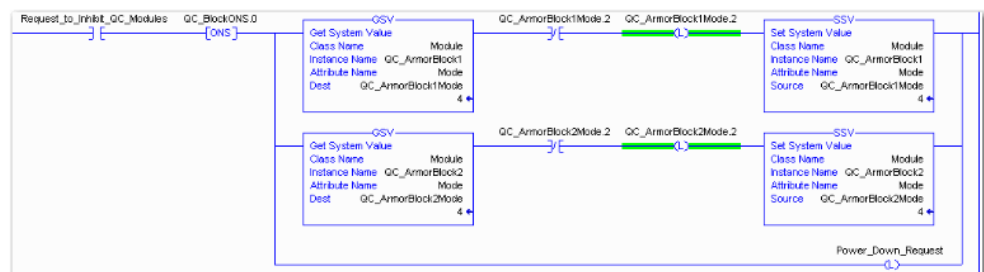

Inhibit and Power Down

Add this logic to inhibit and power down the QuickConnect modules.

1. Rung 0: Inhibit the modules.

Before making a tool change, you must uninhibit the QuickConnect ArmorBlock I/O modules mounted to the tool before powering down. Use a GSV (Mode) instruction to monitor the present state of the modules and one SSV (Mode) instruction per module to inhibit the modules.

The input condition to start the inhibit process must come from an external input. For example, as the robot is traveling back to change out the tool, this input condition must be enabled. By the time the tool is being changed, the modules are inhibited and can proceed to powering down the tool and modules.

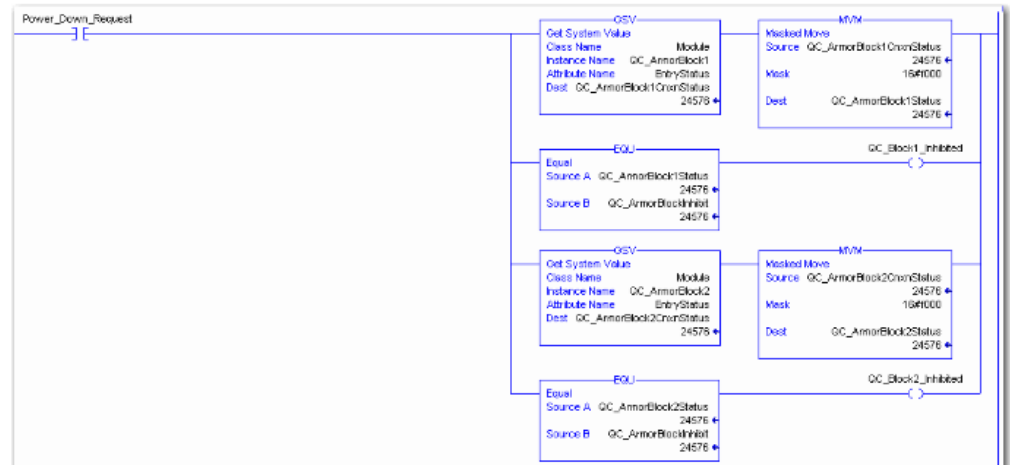

Source:
Allen-Bradley Ethernet/IP QuickConnect Application Technique, Page 29

6 Configuration via Explicit Messages

2. Rung 1: Verify the modules are inhibited.

After the modules have been inhibited, verify that the modules have indeed been inhibited. Use one GSV (Entry Status) instruction per module. When the Entry Status value equals a decimal value of 24576, the module can be disconnected from the robotic arm and powered down.

3. Rung 2: Power down the modules.

This rung verifies that all the modules have been inhibited and powered down. The tool and modules can be physically disconnected from the robotic arm.

Source:

Allen-Bradley Ethernet/IP QuickConnect Application Technique, Page 30

BALLUFF

25

1. Rung 3: Power up the modules.

Once the tool and module is connected, an external input module sends an electrical lock input signal. On receipt of the signal, start a timer to keep track of how long the tool and modules have been connected.

Every QuickConnect ArmorBlock I/O module has a delay time embedded in its electronic data sheet (EDS) file. This delay time is the amount of time the module takes to power up. The module takes about 300 ms to fully power up before establishing a connection to the controller.

2. Rung 4: Uninhibit the modules.

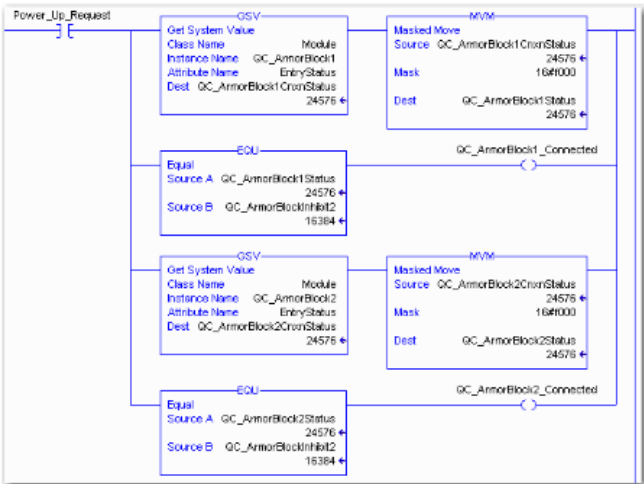

When the Timer.Acc is greater then or equal to the module delay time (300 ms), use an SSV (Mode) instruction to uninhibit the module. Use a GSV (Mode) instruction to verify the mode of the module at powerup.

Source:
Allen-Bradley Ethernet/IP QuickConnect Application Technique, Page 31

6 Configuration via Explicit Messages

3. (Optional) Rung 5: Verify the modules are uninhibited.
- After the modules have been uninhibited, verify that the modules have indeed been uninhibited. Use one GSV (Entry Status) instruction per module. When the Entry Status value equals a decimal value of 16384, the module has been uninhibited.

Source:
Allen-Bradley Ethernet/IP QuickConnect Application Technique, Page 32

Fault State

A safe state that the port is to take on in the case of a loss of bus communication can be predefined for each output on the port pins.

The fault state settings can be configured using the following class instance attributes of the explicit messages.

Enable/Disable Fault State

| Class | Instance | Attribute | Value |
|----------|----------|-----------|---|
| 9 (0x09) | 1 - m | 6 | 0: Fault state disabled 1: Fault state enabled |

Fault State Action

| Class | Instance | Attribute | Value |
|----------|----------|-----------|------------------------------------|
| 9 (0x09) | 1 - m | 5 | 0: Output on 1: Hold last state |

m: Number of outputs

Note

The fault state settings are stored only temporarily in the module. They are deleted after a power reset.

To ensure a long-term fault state configuration, the configuration has to be programmed via the PLC so that the settings are transferred to the module again when the system is restarted.

6 Configuration via Explicit Messages

IO-Link Device Parameterization

There are two options for configuring an IO-Link device connected to the IO-Link port.

- Configuration via the web server
refer to the "Web Server" chapter under "Device Properties"
- Configuration via explicit messages

The following example describes how Rockwell RSLogix 5000 devices can be used to configure an IO-Link device via explicit messages.
For this purpose, the "MSG" components in the PLC program are used.

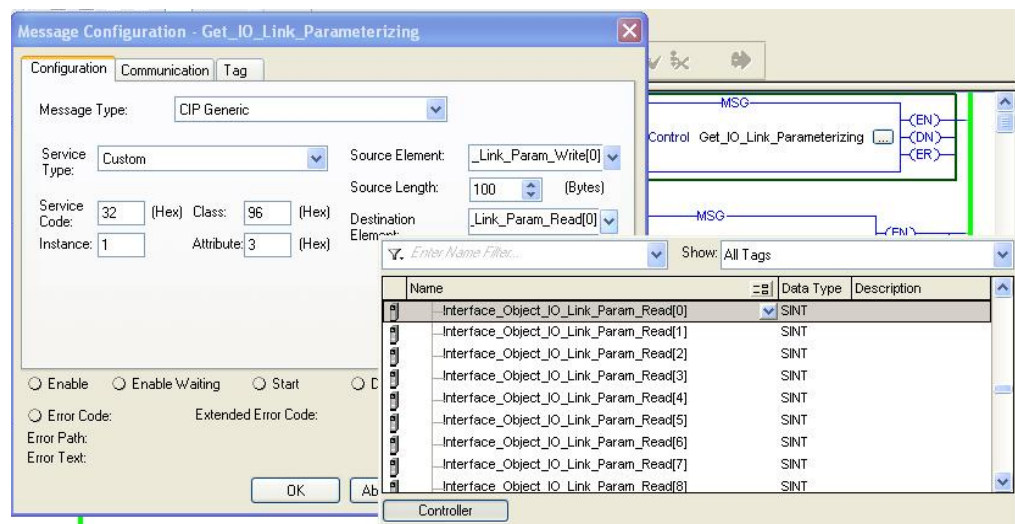

Read IO-Link Parameter

| Service Code | Class | Instance | Attribute |
|--------------|-------|----------|--------------------------|
| 0x32 | 0x96 | 1 - n | 0x03 (Read Parameter) |

n: Number of ports

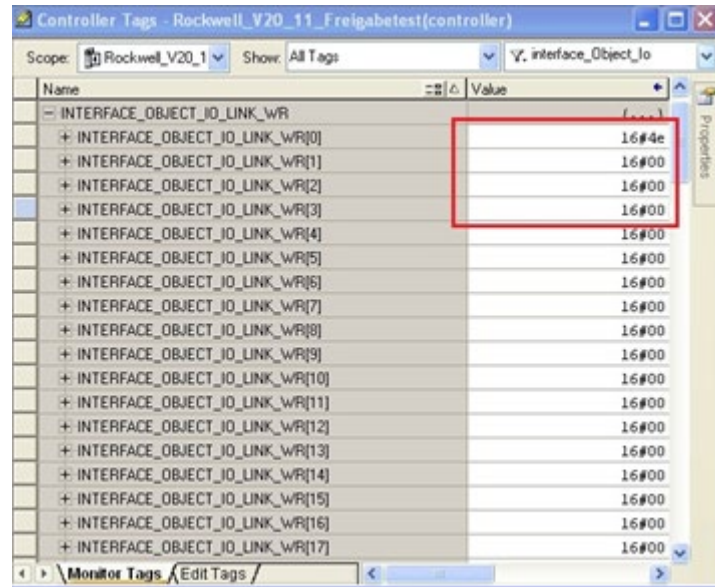

Source Length must correspond to at least the read parameters, but a larger value can also be entered. (In this example, 100 bytes)

As the Source Element (Write) and as the Destination Element (Read), create one SINT[100] array each and select the first line[0].

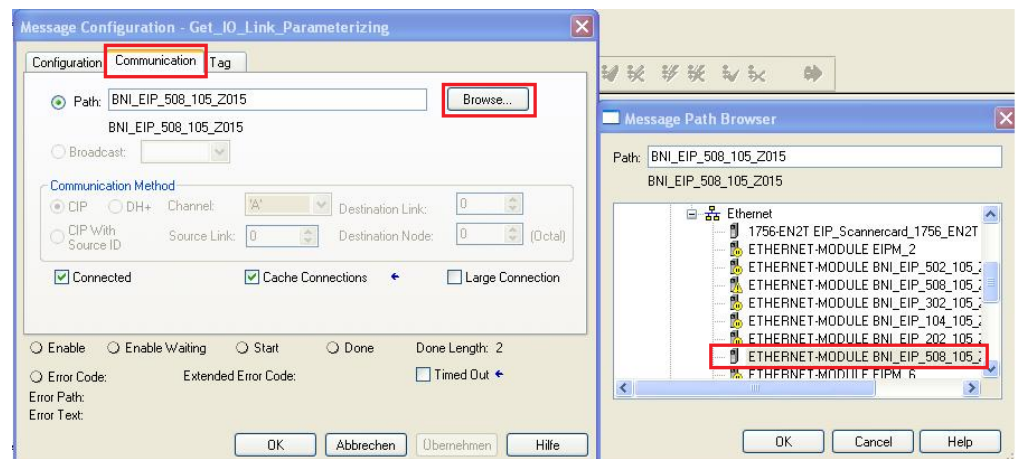

6 Configuration via Explicit Messages

In the Source Element Array (Write), enter which index is to be read.
In this example, this is index 0x4E.

Destination Array (Read) shows the read-out value.
In case of a configuration error, the error code is likewise displayed there.

In the "Communication" window, you have to select the Ethernet module on which the configuration is to take place.

6 Configuration via Explicit Messages

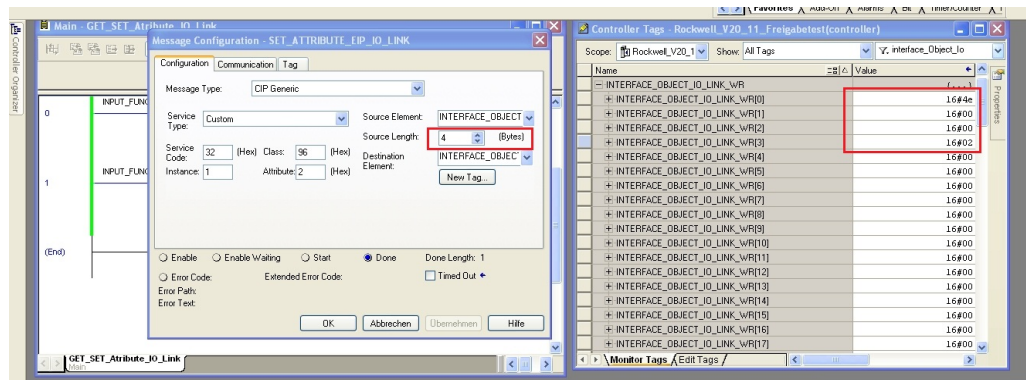

Write IO-Link Parameter

| Service Code | Class | Instance | Attribute |
|--------------|-------|----------|-------------------|
| 0x32 | 0x96 | 1 - n | 0x02 |
| | | | (Write Parameter) |

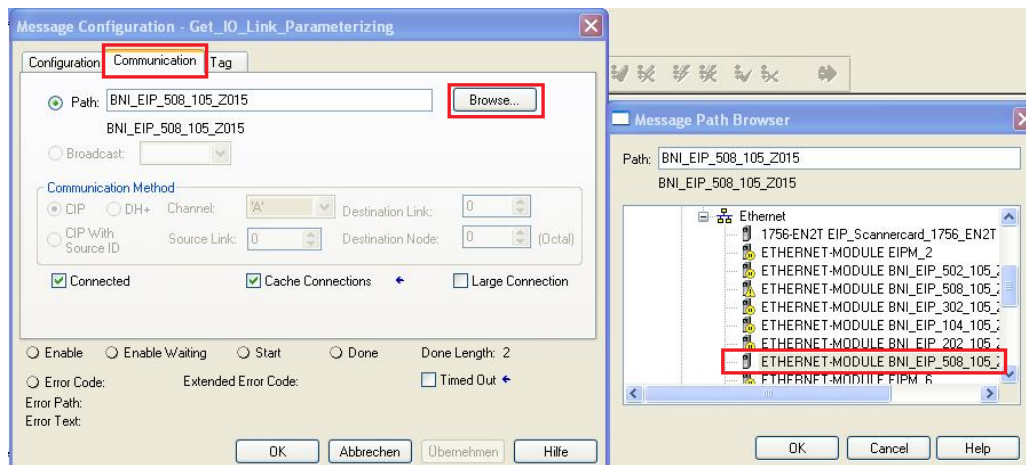

n: Number of ports

Source Element and Destination Element are to be selected so they are identical to the previous example, "Read IO-Link parameter".
The Source Length must be exactly the same length as the parameter data to be written.

In this example, index 0x4E, subindex 0,
value 0x02 is written in Source Element Array (Write).
In case of a configuration error, an error code appears in Destination Element Array (Read).

In the "Communication" window, you likewise have to select the Ethernet module on which the configuration is to take place.

Note

The explicit messages functions are implemented in accordance with the
Volume 1: Common Industrial Protocol Specification and
Volume 2: Ethernet/IP Adaption of CIP.

7 Process Data

7.1. Process Data Inputs

The input data size is 200 bytes. Take a look at the tables below for the allocation of the process data inputs.

BNI EIP-502-105-Z015

| Byte | Module part | Description |
|-----------|--------------------|--|
| 0...7 | Standard I/O ports | Process data inputs at the standard inputs |
| 8...55 | IO-Link port 1 | Process data inputs at IO-Link port 1 |
| 56...103 | IO-Link port 2 | Process data inputs at IO-Link port 2 |
| 104...151 | IO-Link port 3 | Process data inputs at IO-Link port 3 |
| 152...199 | IO-Link port 4 | Process data inputs at IO-Link port 4 |

BNI EIP-508-105-Z015

| Byte | Module part | Description |
|-----------|--------------------|--|
| 0...7 | Standard I/O ports | Process data inputs at the standard inputs |
| 8...55 | IO-Link Port 0 | Process data inputs at IO-Link port 0 |
| 56...103 | IO-Link port 1 | Process data inputs at IO-Link port 1 |
| 104...151 | IO-Link port 2 | Process data inputs at IO-Link port 2 |
| 152...199 | IO-Link port 3 | Process data inputs at IO-Link port 3 |
| 200...247 | IO-Link port 4 | Process data inputs at IO-Link port 4 |
| 248...295 | IO-Link port 5 | Process data inputs at IO-Link port 5 |
| 296...343 | IO-Link port 6 | Process data inputs at IO-Link port 6 |
| 344...391 | IO-Link port 7 | Process data inputs at IO-Link port 7 |

Standard Input Data

BNI EIP-502-105-Z015 and BNI EIP-508-105-Z015

| Byte | Bit | | | | | | | | Description |

IO-Link Output Data

| Byte | Bit | | | | | | | | Description |
|--------|-----|---|---|---|---|---|---|---|--|
| | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| 6...37 | | | | | | | | | IO-Link port 0 output data |
| ... | | | | | | | | | The data of the other IO-Link ports are structured identically and described in the following. |

8.1. General

With the implemented display, the address is output directly to the devices BNI EIP...
The following address types are possible:

- IP address
- Subnet mask
- Gateway address

Each address is composed of 4 octets.

The display also shows information about the hardware and firmware update.

The display has a locking function that can be enabled from the control panel. If the lock is set, no more editing can be done (see bit layout, Chapter 6.2 Standard output data).

8.2. Address Specifications

IP address: 192.168.1.1
Subnet mask: 255.255.255.0
Gateway address: 192.168.1.1

8.3. Control and Display

- 1 Display
- 2 Arrow key
- 3 Octet cursor

- 4 Address type cursor
- 5 "Set" key
- 6 LED

8.4. Display Information

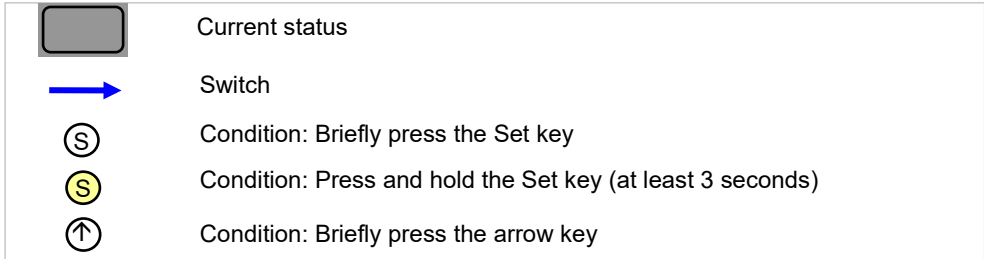

IP: IP address
SN: Subnet address
GW: Gateway address

3: First octet
2: Second octet
1: Third octet
0: Fourth octet

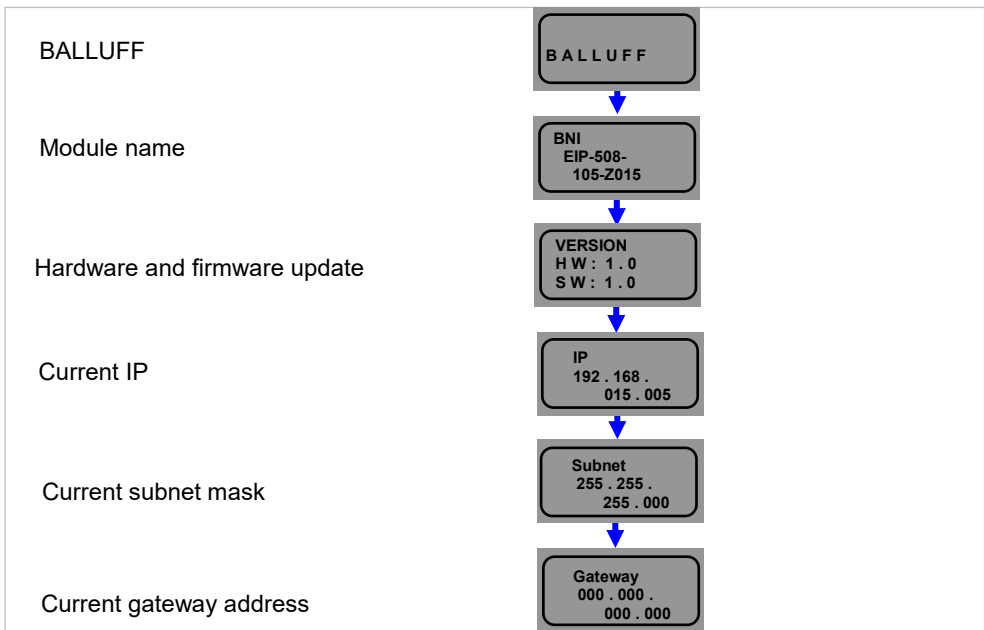

8 Display

8.5. Design and Symbols

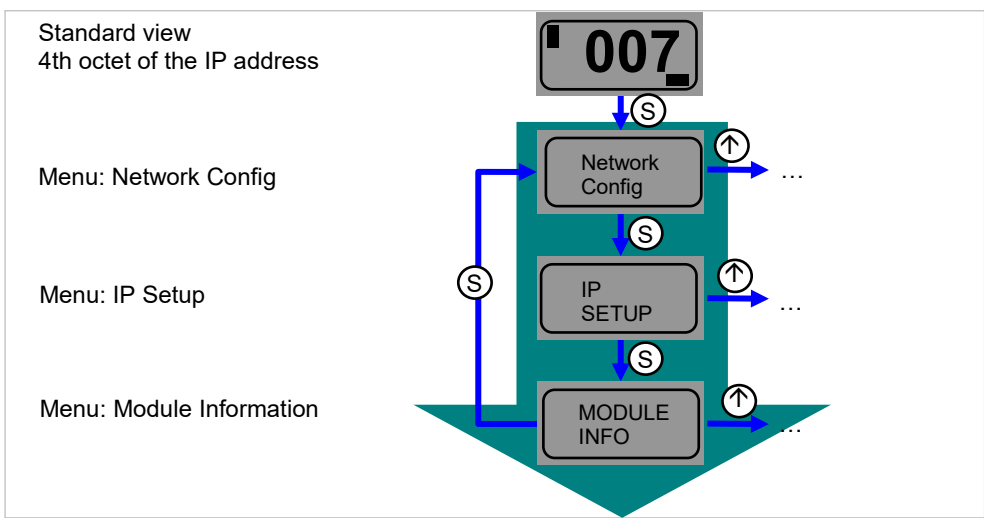

In the following flow charts, some symbols are used to describe the display functionality:

8.6. Startup

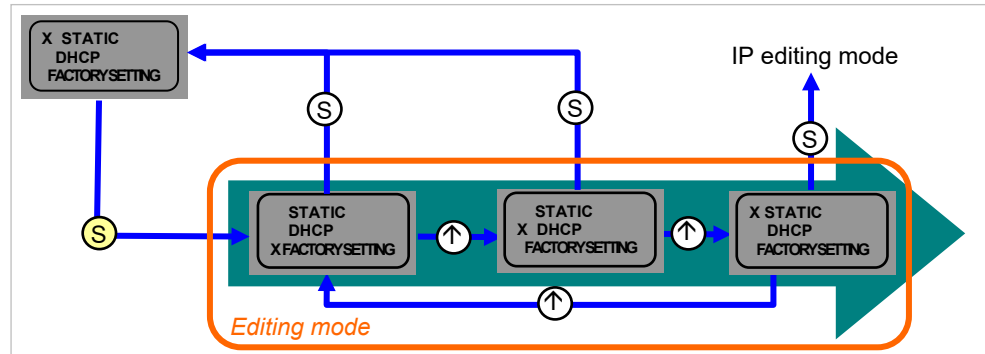

8.7. Main Menu

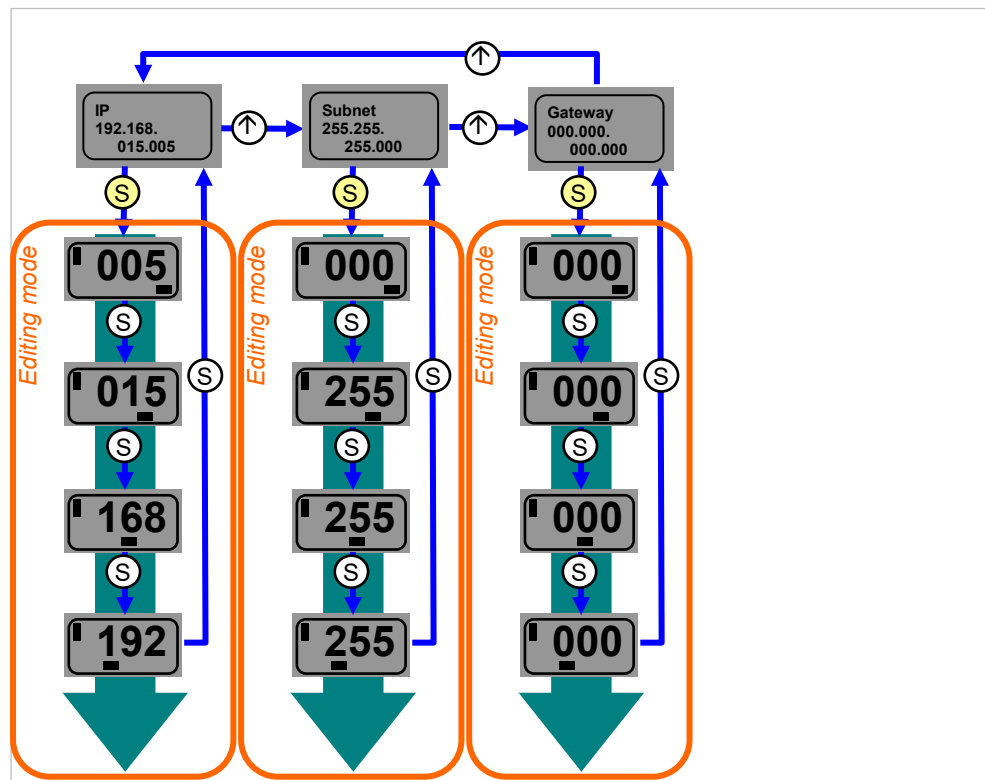

- Press the Set key briefly to scroll through the main menu.
- Press the arrow key to open the menu.

8.8. IP Setup

- Press and hold the Set key to call up the editing mode.
- The preferred value is configured by briefly pressing the arrow key.

8.9. Network Config

- Press and hold the Set key to call up the editing mode.
- The preferred value is configured by briefly pressing the arrow key.
- Press and hold the arrow key to call up the fast program mode.
- Briefly pressing the Set key saves the entered value and scrolls to the next octet. The 4th octet represents the beginning of the editing process.
- The completely entered address is saved by briefly pressing the Set key when editing the first octet. The entered value appears right afterwards in the IP overview display.
- Manual changes to IP, subnet or gateway lead to an automatic change of the IP setup to "static".

8 Display

8.10. Edit mode

- In the Network Configuration menu, select IP / Subnet or Gateway Address.
- Press the set button long to switch to edit mode.
- Press the arrow key briefly to change the number.
- Press the Set button briefly to move to the next position.
- After the last digit, press the set button briefly to move to the next octet of the address or to accept the new number after the last octet.

Note

The module has to be restarted to work with the new configuration.

8.11. Module Information

- Briefly pressing the arrow key allows scrolling through the "Module information" menu.
- The product name, module updates and Mac-ID are displayed as information.

8.12. General Information

- Press and hold the arrow key to scroll quickly in editing mode.
- If no key is pressed for 10 seconds, the view reverts to the standard display (4th octet of the IP address). Changes that have not been saved will be lost.
- Differences between the new configuration and the configuration with which the module works are indicated by an unequal sign. In this case, the screen switches to the standard display after 5 seconds.
- The display flashes in editing mode. The display flickers in fast scroll mode.
- If the module receives a single ping, the word "Ping" appears on the display for a couple of seconds. Then the previous display returns. You can exit ping mode sooner by briefly pressing the Set key.
- If the module receives two or more pings, the word "Ping" appears on the display. You can exit the display only by briefly pressing the Set key. Then the display before the ping returns.
- The LED function of the display LEDs can be set in a user-specific manner by setting several bits in the process data outputs. (see bit layout, standard output data)
- The plc lock function can also be used by setting a bit in the process data outputs. (see bit layout, standard output data)

Note

You cannot select editing mode in the display if the plc lock is set in the process data inputs by a bit (see bit layout, standard output data)

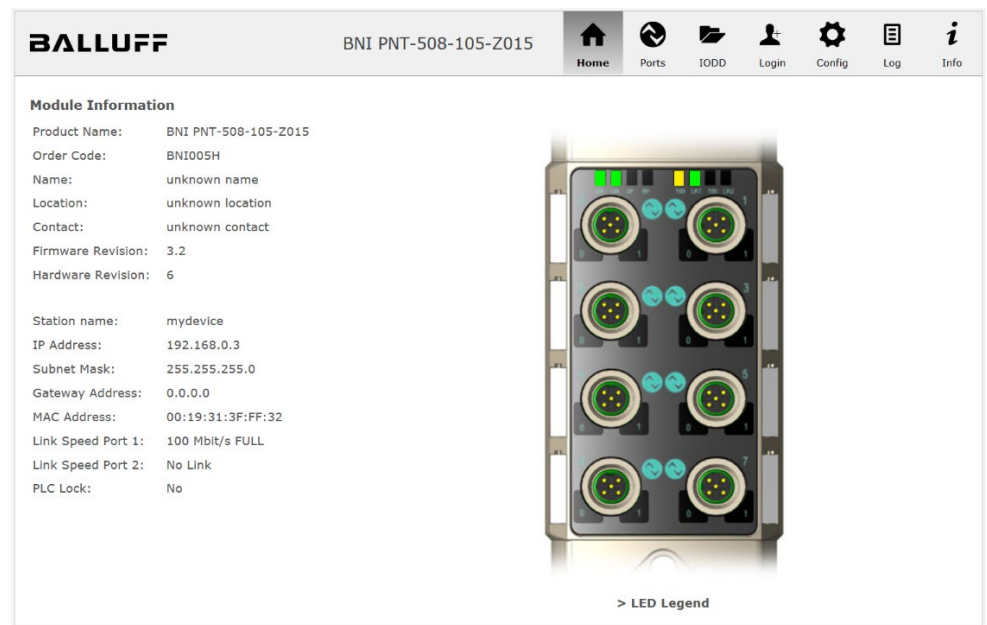

9 Web Server

9.1. General

The BNI fieldbus module contains an integrated web server for retrieving detailed device information and for configuring the device.

To use the web interface you must first ensure that the module has been correctly integrated into your network. In addition the IP subnet of the BNI module must be accessible from the PC on which the browser is running. For the supported web browsers, please refer to the corresponding data sheet.

For open a connection with the web server, enter the IP address of the module in the address line of the browser. The homepage then appears with the essential device information.

9.2. Navigation / Info

The navigation bar is located in the upper area of the window, which allows you to switch between the various dialogs of the web interface. To do this click on the corresponding icon.

When the "Info" tab is selected the following overview appears:

The "BALLUFF" logo at upper right links to the international Balluff homepage.

9 Web Server

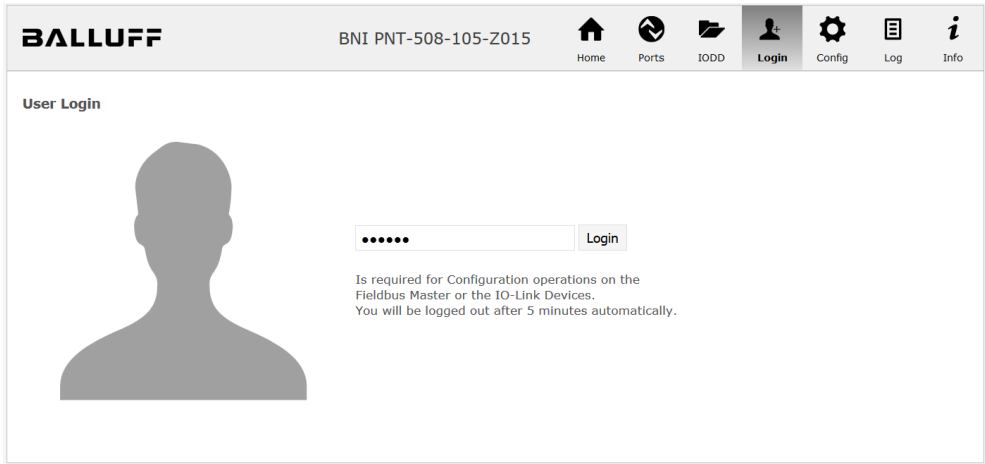

9.3. Login/Logout

To make configuration settings on the fieldbus module using the web interface, you must first log in. Functionalities which cannot be used without logging in are indicated by the grayed out buttons.

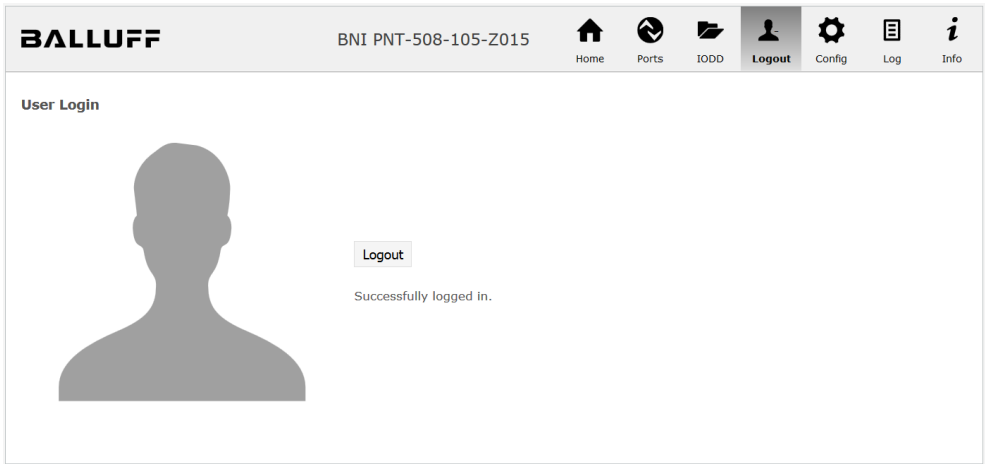

The default password is:

| | |
|----------------------|----------|
| BNI PNT-XXX-XXX-XXXX | "BNIPNT" |
| BNI EIP-XXX-XXX-XXXX | "BNIEIP" |
| BNI ECT-XXX-XXX-XXXX | "BNIECT" |

The password cannot be changed!

After successfully logging in the dialogs are shown as follows:

Use the "Logout" button to log out again. After 5 minutes of no interaction with the Webserver the user is automatically logged out.

Note
For security reasons the fieldbus module shows only one login at a time with configuration access. Reading (without logging in) is however possible from multiple PCs at the same time on the fieldbus module.

PNT:

| IO-Link | IO-Link |
| IO-Link | IO-Link |

9.5. "Ports" dialog

The "Ports" dialog displays information and process data for the connected IO-Link devices. Select the desired IO-Link Port in the image of the fieldbus module on the right side to see the device data.

**Note**

The IO-Link device data are only displayed if the port is also configured as an IO-Link port!

No appropriate IODD uploaded

It is possible to read and write the configuration parameters of the IO-Link device via the "Parameters" option. The parameter indexes and subindexes of the IO-Link device are described in the corresponding separate user's guide (and follow the IO-Link conventions).

Under "Events" you can see whether a diagnostic event from the IO-Link device exists.

Under "Parameter Server Content" you can view the content of the parameter server if parameter data is stored on the parameter server.

The screenshot shows the BALLUFF web interface for the BNI PNT-508-105-Z015 device. The 'Ports' tab is active, displaying the 'IO-Link Device Properties (Port 0)'. The interface includes a navigation bar with icons for Home, Ports, IODD, Logout, Config, Log, and Info. The main content area is divided into several sections:

- Identification Data:** Lists device details such as Vendor ID (0x050D20), Device ID, Vendor Name (BALLUFF), Vendor Text (www.balluff.com), Product Name (BNI IOL-302-002-Z046), Product ID (BNI00AU), Product Text (Sensor/Actor hub M8), Serial Number (7A 69 68 67 6A 68 73 6C 66 61 6A 6B F6 64 6C 75), Hardware Revision (1), Firmware Revision (1.0 2016/03/08 09:05:24 R2920), and Application specific tag.
- Process Data:** Shows Inputs (hex): 20 00 and Outputs (hex): 00 00.
- Parameters:** Includes input fields for Index, Subindex, and Data (hex), along with a Result field and radio buttons for Read (selected) and Write. There are 'Apply' and 'Clear' buttons.
- Events:** Displays the 'Current Event' as 'Secondary supply voltage fault (Port Class B) - Check tolerance'.
- Parameter server content:** Lists Vendor ID (hex): 00 00, Device ID (hex): 00 00 00, Checksum (hex): 00 00 00 00, and Content (hex): (none).

On the right side of the 'Identification Data' section, there is a visual representation of the fieldbus module with a grid of ports, where one port is highlighted to indicate the selected device.

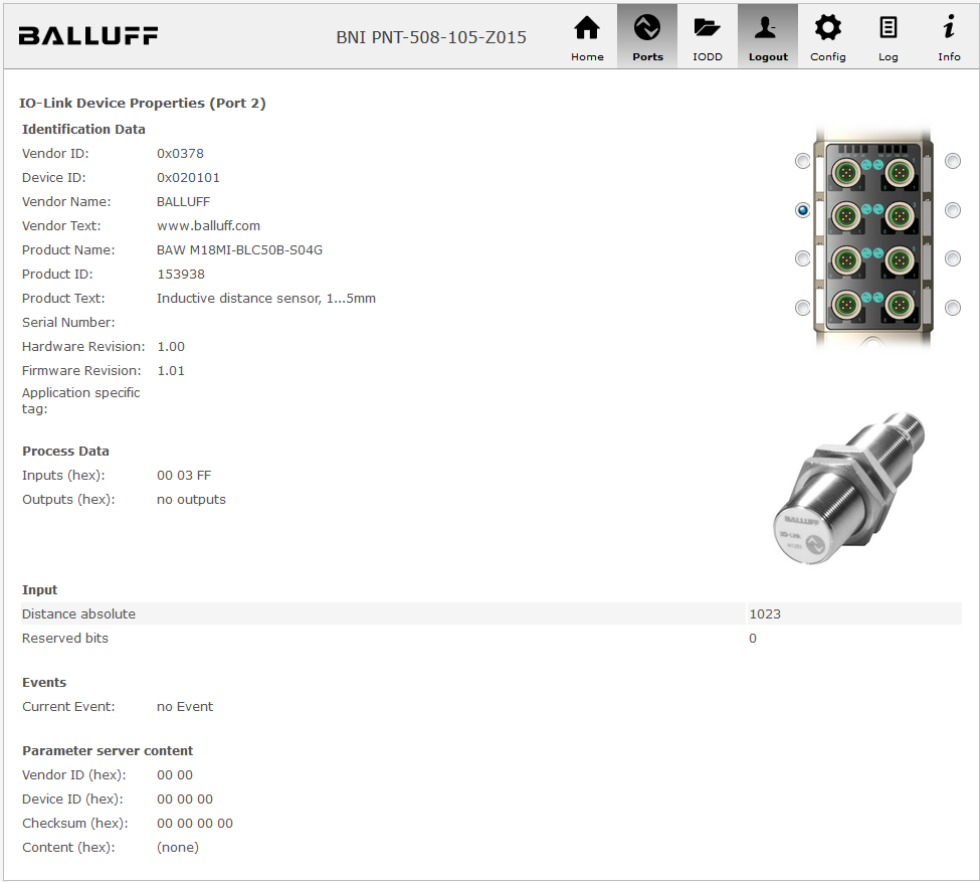

"Ports" dialog with direct parameter access

9 Web Server

Appropriate IODD uploaded

If an IODD appropriate to the IO-Link device connected to the currently selected port has been uploaded (see "Dialog "IODD""), the normal dialog for "Process Data" and "Parameters" is not displayed, but rather an expanded dialog. Information from the IODD of the device is used so that the data can be better understood.

Thus in the following screenshot not only are the input data of the distance sensor displayed as a hex number, but also interpreted and labeled under "Input". Since the sensor has no parameters, none are displayed.

Dialog "Ports": IODD interpretation and device image

If the IODD of the IO-Link device on the currently selected port has parameters, these are shown in table format (see following screenshot). In this example the parameters for the Balluff Smart Light are shown.

The Smart Light is a signal light which can be used in three different modes. These modes can be set using an IO-Link parameter. The parameter values and associated texts are stored in the IODD.

This means "Operation Mode" can be read out and displayed ("Read" and "Read All" buttons) or written to the device ("Write" button).

If subindexes have no buttons they cannot be individually processed but rather only the entire index at once.

Note

Each changed value must be individually written by clicking on the "Write" button!

| Parameters | | | | Read All |
|------------|------------------------------------|--|-------|----------|
| 64 (0) | Operating mode (rw) | Segment mode ▾ | Write | Read |
| 65 (0) | Number of segments (rw) | One segment ▾ | Write | Read |
| 66 (0) | Type of level indicator (rw) | Bottom-up ▾ | Write | Read |
| 67 (0) | Resolution of level indicator (rw) | 8 bit ▾ | Write | Read |
| 68 (0) | Level mode, segment 1 (rw) | See child elements | | |
| 68 (1) | Level mode, segment 1 color | Off ▾ | Write | Read |
| 68 (2) | Level mode, segment 1 dominance | <input checked="" type="radio"/> Color is not dominant <input type="radio"/> Color is dominant | Write | Read |
| 69 (0) | Level mode, segment 2 (rw) | See child elements | | |
| 69 (1) | Level mode, segment 2 color | Off ▾ | Write | Read |

"Ports" dialog: Parameter list of an IO-Link device with uploaded IODD

9 Web Server

9.6. "IODD" dialog

Using this dialog you can transfer IODDs (device description files for IO-Link devices) and the associated device images to the fieldbus module, so that a detailed representation of the connected IO-Link devices in the "Ports" dialog is possible.

When IO-Link devices are connected and IO-Link ports are activated, the dialog shows a table with information about the IO-Link devices.

The fieldbus module file system supports only device names in "8+3" format, i.e. with a restricted name length. Since IODD files are generally published with a long file name, these must be renamed and given a shorter naming scheme on the PC before uploading to the fieldbus module.

For this a help setting is provided in the dialog, with the associated required IODD file name for the currently connected IO-Link devices shown in the bottom section of the list (column IODD Filename).

Image files without IODD can also be uploaded; the images are still displayed in the "Ports" dialog.

Information

This module has a FAT12 file system, which means it supports only file names in 8.3 convention. **Please rename your IODDs according to the suggested filename in the table below.**

The suggested filename is generated according to following rule:

- The first two characters of the file name are the first two letters of the IODD Vendor Name. If the device has no vendor name, those characters are substituted by underscores.
- The remaining 6 characters must encode the DeviceID in hexadecimal representation (padded with zeros if necessary).

Note that the filename must contain the DeviceID that is in the IODD file!

Currently connected IO - Link Devices:

| Vendor Name | Product Name | Product ID | Vendor ID | Device ID | IODD Filename |
|-------------|-----------------------|------------|-----------|-----------|---------------|
| BALLUFF | BNI IOL-302-002-Z046 | BNI00AU | 0000 | 050D20 | BA050D20.xml |
| BALLUFF | BNI IOL-802-000-Z036 | BNI0072 | 0378 | 050A01 | BA050A01.xml |
| BALLUFF | BAW M18MI-BLCS0B-S04G | 153938 | 0378 | 020101 | BA020101.xml |

Using the "Delete" button you can delete IODDs and device images from the fieldbus when needed.

Note

Before selecting the IODD it must be renamed on the PC to the file name which is shown in the table in the "IODD Filename" column!

9.7. "Config" dialog

The configuration page enables configuration of the module. You can change both the module information texts and the port configuration.

The "Set Ports" action is not permanently stored in the device and is lost after the next reboot or reset.

9 Web Server

EIP:

The screenshot displays the web interface for the Balluff BNI EIP-508-105-Z015 module. The interface is divided into two main sections: Module Configuration and Port Configuration.

Module Configuration:

- Name:** Balluff GmbH
- Location:** Schurwaldstraße 9
- Contact:** +49 (0) 7158 173
- Network Settings:**
 - ☐ DHCP Client
 - ☒ Static IP
 - IP Address:** 192.168.0.159
 - Subnet Mask:** 255.255.255.0
 - Gateway Address:** 192.168.0.1
 - ☐ Factory IP
 - IP Address:** 192.168.1.1
 - Subnet Mask:** 255.255.255.0
 - Gateway Address:** 192.168.1.1

Port Configuration:

The Port Configuration section shows a central image of the module with pins 1 through 16. To the left and right of the image are dropdown menus for configuring each pin's mode. The modes are set as follows:

- Pins 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16: Digital Input/Output
- Pins 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16: IO Link

At the bottom of the interface, there are buttons for "Save Configuration", "Reboot", "Factory Reset", and "Set Ports".

The parameter set "Module Configuration" on the left side is used by clicking "Save Configuration" and permanently stored in the device.

The "Reboot" button reboots the device as if the power to the module had been turned off and on again.

Clicking on "Factory Reset" deletes the configuration and log files saved in the device and then performs a reboot, so that the device is restored to the default factory configuration as on delivery.

9.8. "Log" dialog

This dialog provides general service information about the device as well as a logging function.

The upper table (see screenshot below) contains important information for all service inquiries.

**Note**

If you have a detailed question about a specific situation, send us a screenshot of this Website or print the site as a PDF.

Logging shows events which have occurred in chronological order. This provides a tool for detailed troubleshooting in equipment.

9 Web Server

Events are classified using the "**Severity**" column:

Internal Error (Emergency, Alert, Critical)

- The fieldbus module has detected a fault in itself (hardware or software) which should not occur during normal operation. If this happens, the module must be serviced or replaced.

External Error (Error, Warning)

- The fieldbus module has detected what may be a non-permissible event which is affecting the module from the outside. The system may require troubleshooting.

Event (Informational, Notice)

The fieldbus module has detected an important normal operating event and reports it. These may include for example configuration actions over the web interface and other configuration interfaces which are also recorded.

Clicking on "Set Module Time" sends the current browser time to the fieldbus module but does not permanently store it. After a reset, reboot or loss of power the time begins to run again from the year 2000.

Clicking on "Update Log" refreshes the display, and "Clear Log" deletes all entries. The log entries are stored in a ring buffer.

10 Appendix

10.1. Scope of Delivery

The BNI EIP comprises the following elements:

- IO-Link block
- 4x M12 dummy plugs
- Ground strap
- M4x6 screw
- 20 informational signs

10.2. Order Number

BNI EIP-50x-105-Z015

Balluff Network Interface

Ethernet IP

Functions

502 = IP 67 IO-Link master module, 4 IO-Link ports

508 = IP 67 IO-Link master module, 8 IO-Link ports

Versions

105 = display version, 2-port switch

Mechanical version

Z015 = Die cast zinc housing

Data transmission: 2 x M12x1 internal thread

Power supply: 7/8" external thread, 7/8" internal thread

Sensor connections: 8 x M12x1 internal thread

10.3. Ordering Information

| Product order code | Order code |
|----------------------|------------|
| BNI EIP-502-105-Z015 | BNI004A |
| BNI EIP-508-105-Z015 | BNI006A |
